# The facts about
SAFE WEB BROWSING

Beware of the first search result.

Hackers will use SEO techniques to put dangerous, fake sites at the top of the search results. Choose carefully before you click.

Avoid clicking email links.

If an email asks you to go to a certain site, navigate via the address bar or a bookmark instead. Hackers send bait emails containing dangerous links.

Look out for fake warnings!

Security warnings and antivirus pop-ups may be fakes. Be especially careful with warnings and pop-ups that want you to download something. That's one way for malware to get into your system!

Keep calm.

This is the most important thing. Scammers on the web want you to act quickly and carelessly. Take a deep breath and don't let yourself be pressured.
